Core Lab Interaction

Homework 4

Introduction to Javascript

Create an empty .html file with this code:

```
<!DOCTYPE html>
<html>
<body>
</body>
<script>

</script>
</html>
```

Inside your .html file, in the <script> section

1. console.log your name. make sure to put your name in "quotes".

2. make 2 variables. put numbers in them. any numbers.

3. multiply these variables together and store the result into a third variable. (just as addition uses +, multiplication uses the * symbol)

4. console log the third variable and double check the math works out.

Reply to this email and answer this question

5. what does javascript do when you add a string and a number together?

remember you use "var" to declare a variable, it carves out the spot in memory. for each variable, you only use "var" once.
