Core Lab Interaction

Homework 3

Cafe Menu

Create a menu for a cafe or restaurant of your imagination. It can be a menu for drinks or food or both. It can have prices, or descriptions of food, or options for food like toppings and sauces, or ingredients, or information about food allergies, or any other information about the items.

There should be 3 sections to your page:
- header
- columns (left and right)

The top of the page should contain the name of the cafe and can contain any other information like address, hours, other information about the cafe. Food or drink items should be in the columns.

Requirements

- Use (at least) 2 Google Fonts and (at least) 2 different font weights (only necessary once, on one font)
- Let's have at least 8 food items
- By using @media query make it so the right column shifts below the left column when the browser window width shrinks past a certain point.

Some helpful thoughts

- search the internet for real world examples. Use the Chrome Inspector to see how people lay out their text. in class example: russanddaughterscafe.com
- Container <div>s are your friend
- for @media query: use float:left and float:none, and possibly adjust width also
